

Aruba Central Migration Assistant

CLI / Classic Central → New Central · Migration Readiness Tool

Overview

A migration readiness tool that connects to an Aruba Central tenant, discovers the full deployment, and produces a comprehensive migration plan without pushing any changes. It bridges legacy CLI-based configuration templates and the newer Element Profiles model, using a deterministic multi-phase pipeline to map every CLI configuration block to its equivalent profile and classify scope across a five-level hierarchy (Global → Site Collection → Site → Device Group → Device).

Highlights

- Validated against large-scale production-style deployments (100K+ devices, 700+ groups)
- Full tenant discovery completes in roughly 12 minutes using an optimized API call pipeline
- Deduplicates near-identical templates down to a smaller set of unique profiles
- Generates a multi-tab migration intelligence report: inventory, mapping, compatibility, risk, and strategy
- Read-only by design — write/push operations are disabled by default

Tech Stack

Python, FastAPI, TextFSM (CLI parsing), regex + deterministic rule mapping, React frontend, Aruba Central REST API.
