

CNX Ticket Analyzer

Support Operations · Ticket & Issue Cross-Referencing Tool

Overview

A local-first analytics tool that cross-references customer support tickets with engineering issue-tracker entries, surfacing patterns across product component, technology area, and regression trends. It supports both a point-in-time workbook view and a live-query mode against a self-hosted issue tracker, so findings can be either a snapshot or always current — all processing happens on the user's own machine, and no data is uploaded to any third party.

Highlights

- Cross-references two independent ticket data sources entirely on-device
- KPI dashboard summarizing ticket volume by customer, component, and technology area
- Optional live-query mode against a self-hosted issue tracker via a personal access token
- Multi-select filtering (component, label, status, priority, severity) compiled into a query client-side
- Paginated browsing with a safety-capped export so large result sets stay manageable

Tech Stack

Python, FastAPI, pandas (workbook analysis), REST API integration, vanilla JS frontend.
